

Water Quality Modeling of the Lower Columbia and Snake River Systems

U.S. Army Corps of Engineers, Northwestern Division
September 17, 1999

Marshall C. Richmond

Hydrology Group

Pacific Northwest National Laboratory

marshall.richmond@pnl.gov

(509) 372-6241

Objectives

- ◆ Present a brief comparison of key characteristics of 3 recent water quality models applied to the Columbia and Snake River systems
- ◆ Consumer Warning: may reflect my incomplete knowledge about the other modeling work (if in doubt - refer to original reports and authors)

Models

- ◆ Pacific Northwest National Laboratory (PNNL) - Richmond and Perkins
 - MASS1 : 1D, unsteady hydrodynamics and water quality (temperature and dissolved gas)
 - MASS2 : 2D depth-averaged hydrodynamics and water quality (temperature and dissolved gas)
 - active development and maintenance of models
- ◆ US EPA, Region 10 (EPA) - Yearsley
 - 1D, steady hydrodynamics, unsteady water quality (temperature)
 - active development and maintenance of model
- ◆ Normandeau Associates
 - WQRRS : 1D, unsteady hydrodynamics and water quality, biology
 - “off the shelf application”, WQRRS does not appear to be actively maintained ?

General Snake River Application Features

- ◆ PNNL MASS1
 - applied to current and unimpounded conditions
- ◆ PNNL MASS2
 - applied to current and unimpounded conditions
- ◆ EPA
 - applied to current and unimpounded conditions
- ◆ WQRRS
 - applied only to unimpounded conditions

Geographic Domain

- ◆ PNNL MASS1
 - Columbia river mile 25 upstream to Keenleyside, Dworshak, Hells Canyon
 - Snake application is a subset (SRM 0 - 168)
- ◆ PNNL MASS2
 - Portland upstream to Kennewick, Lewiston, Snake River Mile 168
- ◆ EPA
 - Bonneville upstream to Grand Coulee and Lewiston (SRM 139)
- ◆ WQRRS
 - Snake River Mile 0 to 146
- ◆ (focus on the 1D models from here on)

Time Periods for Snake River Applications

◆ PNNL MASS1

- 1996, 1997 : verification
- 1960 -1995 : application (with/without dams)

◆ EPA

- 1990-1995 : calibration(?)
- 1975-1995 : application (with/without dams)

◆ WQRRS

- 1956-1958 : “calibration” - Central Ferry??
- 1994, 1995, 1997 : application (without dams)

Hydrodynamic and Transport Numerical Methods

- ◆ PNNL MASS1
 - Hydrodynamics
 - » full dynamic method (St. Venant) - standard implicit Preissman scheme
 - Transport
 - » explicit TVD for advection - minimal numerical diffusion
 - » split operator for diffusion and source terms (e.g., surface heat flux)
 - » sub time for transport (hydrodynamics not limited to transport time step)
- ◆ EPA
 - Hydrodynamics
 - » Standard steady flow methods and level pool assumption
 - Transport
 - » Lagrangian scheme - minimal numerical diffusion
- ◆ WQRRS
 - Hydrodynamics
 - » modified puls hydrologic (mass balance) method
 - » St. Venant finite-element method not used because of stability problems
 - Transport
 - » Upwind differencing for advection - causes numerical diffusion

Surface Heat Exchange Methods

- ◆ PNNL MASS1
 - surface heat flux
- ◆ EPA
 - surface heat flux
- ◆ WQRRS
 - surface heat flux
- ◆ All methods use very similar parameterizations
- ◆ River bathymetry is important because surface heat flux term is inversely proportional to water depth

Bathymetry and Spatial Resolution

- ◆ PNNL MASS1 and MASS2
 - latest COE surveys, NOAA charts, USGS DEMS, 1934 COE survey for unimpounded conditions
 - automated cross-section generation using Arc/Info GIS system
 - 0.5 mile spatial resolution (finer in some areas)
- ◆ EPA
 - NOAA charts, HEC-2 input data, Other sources
 - variable, 1 - 10 mile resolution
- ◆ WQRRS
 - 1934 COE survey for unimpounded conditions
 - variable, limited by model memory constraints, about 1 mile

Hydrology and Meteorology

- ◆ PNNL MASS1

- hourly flows, water temperature, met data for 1996, 1997
- daily flows and water temperatures 1960-1995
- hourly met data for 1960-1995 (Lewiston)

- ◆ EPA

- daily average flows?
- hourly met data? (Lewiston)

- ◆ WQRRS

- daily average flows
- daily met data with computed hourly radiation (Lewiston and Pasco)

Application Results

◆ PNNL MASS1

- frequency analysis of long-term simulations for current and unimpounded conditions
- dams have reduced temperature variations
- August 50% exceedance temperature at Ice Harbor Dam Location (SRM 9.5)
 - » With Dams : 19.5 deg. C
 - » Without Dams : 20.6 deg. C
- dams shift temperatures cooler in Spring and warmer in Fall compared to unimpounded conditions
- considering all the uncertainties, the absolute temperature difference may not be significant
- additional analysis required to assess uncertainty

Application Results, cont.

◆ EPA

- frequency analysis of long-term simulations for current and unimpounded conditions
- at the Ice Harbor Dam location the magnitude of exceeding 20 deg C is
 - » with dams : 1.8 deg. C
 - » without dams : 1.2 deg. C
- at the Ice Harbor Dam location the frequency of exceeding 20 deg C is
 - » with dams : about 0.18 (figure 30)
 - » without dams : about 0.12 (figure 31)

Application Results, cont.

◆ WQRRS

- general comparison of unimpounded simulation for 1994, 1995, 1997 to measured data for current conditions at specific locations for same years
- higher water temperatures without dams

MASS1 - Lower Monumental Fixed Monitor Comparison

MASS1 - Verification for Hanford Reach 100-F Slough (RM 367)

MASS1 - Snake River Ave.

August Profile

Unimpounded (without dams)

Current (with dams)

MASS1 - Temperature Variation at Ice Harbor Dam Location

Unimpounded (without dams)

Current (with dams)
